The R Journal

Dear Dr Emi Tanaka,

Please consider our article titled “moveEZ: An R Package for Animated Biplots” for publication in the R Journal.

This manuscript introduces the new package called `moveEZ` which provides dynamic visualization tools for multivariate continuous data in which measurements are repeatedly captured. Typically, this would be measurements captured over time or evaluating the changes in measurements in experiments when different factor levels are applied.

Biplot visualizations are constructed using two frameworks for the variable representation in the display; the variable vectors can be fixed across the time variable or animated along with the change in sample representation.

These visualizations can expose changes in measurements as well as changes in the relationship between variables observed over time.

An *easy-to-use* (i.e. EZ) approach is followed in this package and builds on the proposed pipelines of the `biplotEZ` package, its predecessor.

We believe that this package makes a unique contribution to the community as it enables animated biplot displays.
